

Edward Vartanessian

Platform Engineer — AWS · Terraform · Python · OpenTelemetry

Greater Boston | e_vartanessian@live.com | linkedin.com/in/evartanessian | github.com/eddiev2 | evartanessian.dev

SUMMARY

Software engineer specializing in cloud platforms, automation, and observability. 5+ years building on AWS with Terraform and Python: reliability automation for a 10,000+ device fleet at Splunk (custom OpenTelemetry Collector fleet-wide, SLO-driven auto-remediation) and a greenfield procurement platform replacing legacy enterprise SaaS at Cisco. Shipped CopyWarden, an encrypted macOS clipboard manager (copywarden.com). Security-first: zero-trust design and compliance automation for SOC 2, ISO 27001, and UK Cyber Essentials.

SKILLS

Languages: Python, Bash, PowerShell, JavaScript, HCL (Terraform)

Cloud & Infrastructure: AWS (Lambda, EC2, S3, CloudFront, API Gateway, Route 53, Secrets Manager, IAM), Terraform, Docker, Kubernetes, Puppet

CI/CD: GitLab CI, GitHub Actions, Docker-based pipelines, GitOps

Observability & SRE: OpenTelemetry, Splunk, Prometheus, Grafana, SLOs/SLIs, incident management

Platforms & Security: ServiceNow development (scripting, workflows, REST integrations), Okta/IAM-as-code, Tenable, SonarQube, SOC 2 / ISO 27001

EXPERIENCE

Cisco — Software Engineer, Platform

Sept 2025 – Present · joined via Cisco's acquisition of Splunk

- Architecting and building a greenfield internal procurement + ITSM platform on AWS replacing two enterprise SaaS platforms; all infrastructure defined in Terraform
- Designed and stood up the platform's self-service ordering website end to end
- Built ServiceNow automations and integrations — server-side scripting, workflow automation, REST integrations — eliminating manual fulfillment steps
- Drive incident management with automated triage and runbooks

Splunk — Client Platform Engineer (DevOps/SRE)

Apr 2022 – Sept 2025

- Engineered automation for a 10,000+ device fleet (macOS/Windows/Linux) with zero-downtime updates, maintaining SOC 2, ISO 27001, and UK Cyber Essentials compliance
- Built fleet-wide observability on OpenTelemetry + Splunk: health/compliance SLIs, automated alerting, ~100% macOS patch compliance across 10k+ endpoints
- Shipped a custom OpenTelemetry Collector fleet-wide, choosing a minimal purpose-built distribution over vendor agents to keep one vendor-neutral pipeline; identified the Collector's missing macOS CPU/disk host metrics and drove the fix upstream (authored proposal #33393, since shipped)
- Cut security state-change enforcement from hours to <15 minutes (emergency policy rollouts during P0/P1) with SLO-backed alerts and Python/Bash auto-remediation; staged **global** OS rollouts in geographic waves targeted by IP range after opt-in UAT sign-off, containing the blast radius of a bad change to one region and applying updates while machines were idle

- Built Docker-based GitLab CI/CD pipelines; automated AWS (Lambda, EC2, S3, CloudFront, Secrets Manager) with Terraform; owned Puppet for config/state enforcement
- Modernized legacy Perl/Shell automation into Python services in CI/CD, cutting failure rates; led fleet vulnerability remediation (Tenable, SonarQube) against SLAs

Starburst Data — IT / Cloud Engineer

Dec 2020 – Jan 2022

- Sole infrastructure engineer through ~3× growth (100 → 300 employees); multi-cloud infrastructure in Terraform
- Codified Okta IAM as Terraform (groups, app assignments, SCIM) for least-privilege access and fast on/offboarding
- Architected a Jira → Harbor workflow auto-provisioning scoped registry credentials with an audit trail — turnaround cut from hours to minutes

Earlier career — Systems & IT Engineering

2013 – 2020 · Arent Fox, McDermott Will & Emery, LiveCare

- Enterprise Windows/macOS environments, Azure/O365 administration, PowerShell automation, VoIP migration lead

SELECTED PROJECTS

- **CopyWarden** — copywarden.com — encrypted, screen-share-aware clipboard manager for macOS (proprietary; Swift 6, AES-256-GCM, Secure Enclave key wrapping, published threat model). Designed, built, and shipped solo: CI, signed + notarized universal releases, product site on S3 + CloudFront
- **OpenTelemetry Collector** (open source) — authored the upstream proposal for macOS CPU/disk host-metrics support (opentelemetry-collector-contrib #33393, since implemented); ran a custom Collector across a 10,000+ device fleet
- **evartanessian.dev** — this resume's claims, demonstrated: framework-free static site with live SLOs and a public error budget; keyless CI deploys; S3 + CloudFront + ACM in Terraform; source and pipeline public (github.com/eddiev2)

EDUCATION

Eastern Nazarene College — B.A., Computer Science
